HAWAIIAN ISLANDS

CABRINHA

product book 2007

A snapshot of the past season says a lot about where the sport of kitesurfing and Cabrinha are headed for 2007 - 2008.

Bow and High Depower kites have taken over the industry and now make up more than 90% of the kites being sold today. Our decision to offer bridled non-bow designs such as the popular HD kites along with our industry leading Bow designs has allowed us to cover the full spectrum of performance and price with no compromise on safety. Override's depower on demand still remains the best means of depowering your kite in an instant.

The 07 -08 range of Cabrinha kites is more refined and targeted than ever. We have made a much clearer separation in the categories to provide specialized equipment for the most popular styles of riding. We have added a dedicated surf kite and surf boards which epitomize the very soul of the Cabrinha brand.

With the increase in the wind range of our Bow and HD kites came an increase in the load stresses. In 2007 we have implemented strategic counter measures which focus on added durability in the high load areas. Through the use of various materials we now provide a balance of strength and weight to deliver our most durable kites yet. Higher denier materials along the strut and LE seams provide solid stitch holding characteristics and alleviate any possibility for stitch combing. The selective placement of higher weighted material along the trailing edge deters against tears created by "tomahawk" style kite crashes on water, snow, or land.

Our completely new board range offers the highest performance, most advanced boards to date. Lighter weights are achieved through the reduction in our component accessory weights. New molded footpads cradle the sole of your foot like a shoe while dampening impact during those hard landings. Our new lighter foot strap is designed for comfort, easy attachment and adjustment. We've implemented new concave bottom shapes which create grip along the rails and a faster line through the center sections.

Kitesurfing is experiencing growth in many ways throughout the world. Cabrinha Kite Surf Equipment is dedicated to match its pace step for step.

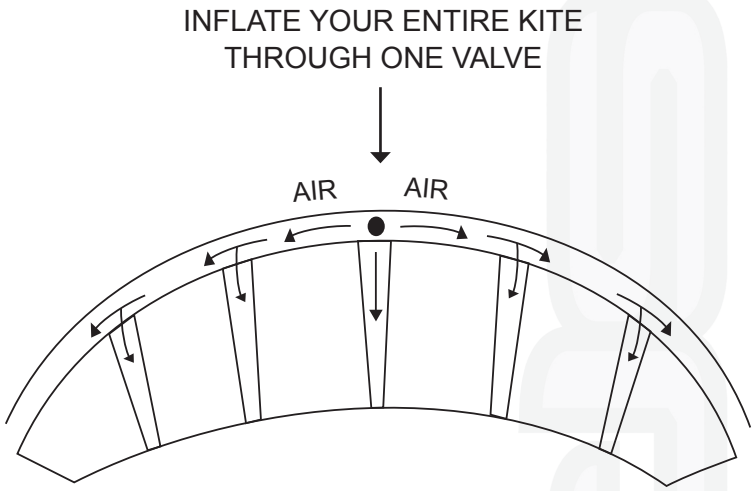
SINGLE POINT RAPID INFLATION SYSTEM

Ease of use has reached a whole new level with the addition of Sprint™ - our unique single point rapid inflation system. Just pull the kite out of the bag, hook the pump to a single valve and inflate the entire kite to the desired pressure.

The supplied leash pump and threaded valve connection keeps your kite under control even when pumping up directly in the wind.

Once the kite is pumped you can choose to clip off, or isolate the air contained in the struts. At the end of the session you can choose to deflate your kite completely by disengaging the strut air clips. Or you can keep your struts inflated and put your kite away rolled up so that the next session will takes just minutes to set up.



3 STEP INFLATION

1. CONNECT

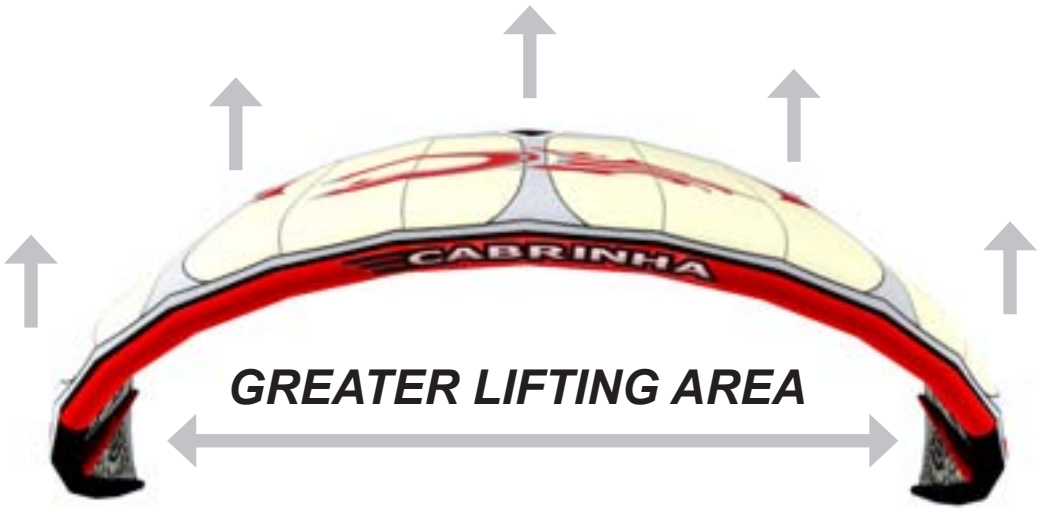
2. INFLATE

3. ISOLATE

Close clip to contain air in struts

SPRINT system made under license of US Patent 7,140,576

pro span extreme
Technology



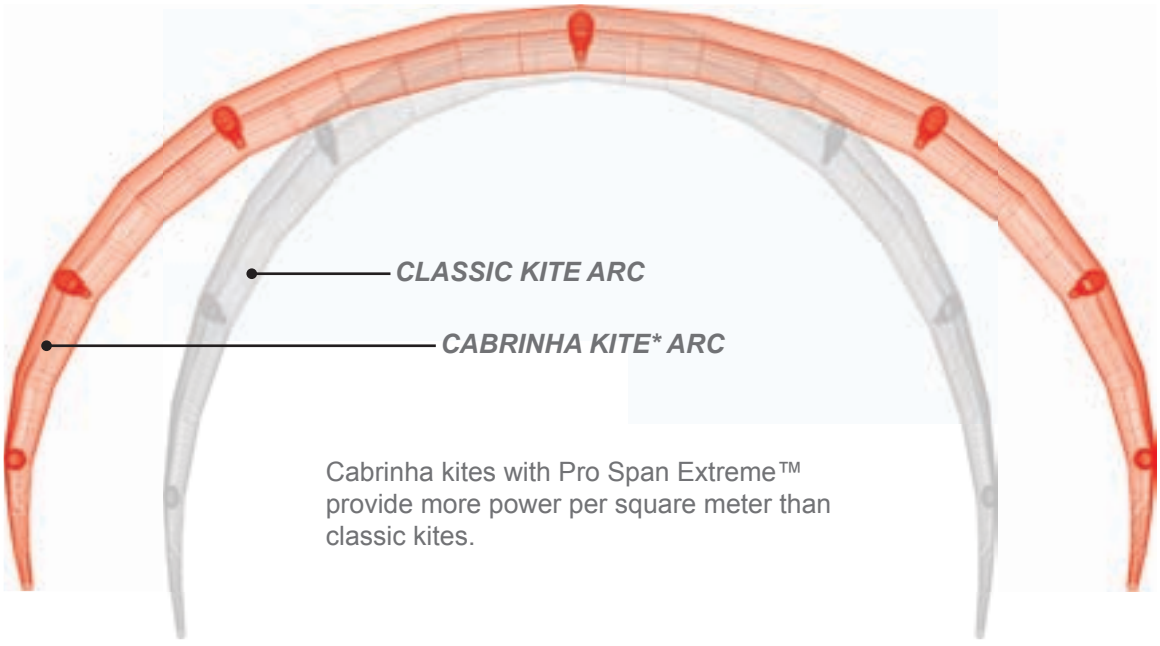
FEATURES

- *> GREATER LIFTING CAPACITY*
- *> MORE POWER PER SQUARE METER*
- *> INCREASED EFFICIENCY*
- *> FLATTER ARC*
- *> EXPANDED WIND RANGE*

DESCRIPTION

Cabrinha Pro Span Extreme™ arc kites surpass all conventional arc kites in terms of raw power, efficiency, range and depower, turning speed, handling, and most importantly ... weight. Thats because the flatter Pro Span Extreme™ arc uses less square surface area to deliver the same power as a conventional arc kite which is much larger in size. Less is more has never rang so true.

PRO SPAN COMPARISON



Cabrinha kites with Pro Span Extreme™ provide more power per square meter than classic kites.

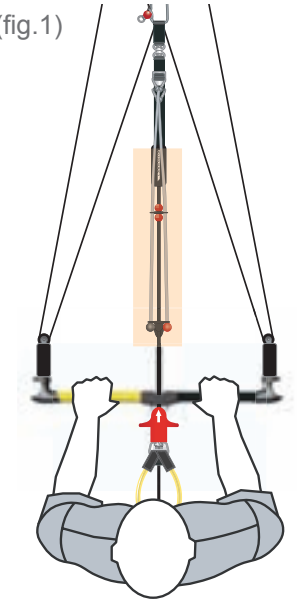
override 2
Technology

OVERRIDE 2: SECURITY SECOND TO NONE

The Override method of depower has become the preferred choice from seasoned pros to 1st time riders. It doesn't get any easier than this. Just place the control bar in the Override mode and the kite will immediately begin to depower and drop from the sky. With Override you can avoid many accidents before they happen by maintaining control of the power of your kite at all times.

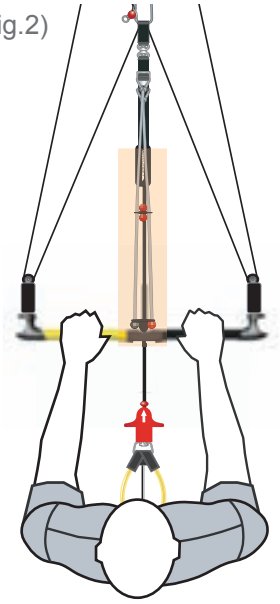
OVERRIDE 2 STEPS

(fig.1)



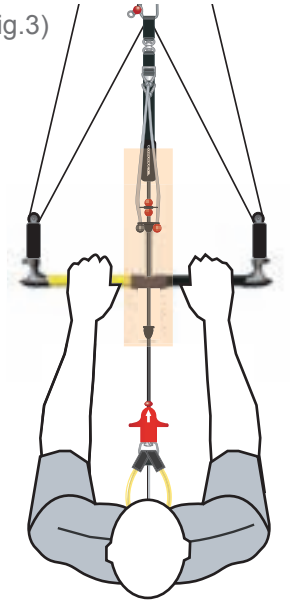
Kite in power position

(fig.2)



Initiate depower by pushing the bar away from you

(fig.3)



Override stopper unit unseated. Bar enters Override mode; kite depowers.

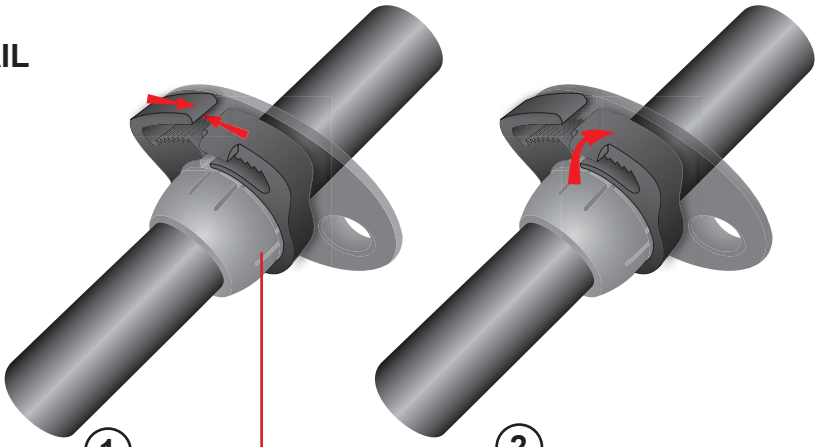
To place the bar into Override mode you can simply push past the stopper unit and the kite will immediately begin to depower and drop from the sky. To depower the kite, push the control bar into the Override Mode, unseating the Override™ 2 Stopper Unit (fig. 2). The kite will immediately depower and begin to drop from the sky (fig. 3). The Override™ 2 Stopper Unit features a positive locking and unlocking action and is now much easier to activate and reset, giving the rider even more freedom to spin the bar or to depower the kite.

The Override 2 stopper unit provides a place to rest your control bar if you'd like to unspin your lines. When the Override stopper unit is seated on its sleeve you can temporarily let go of the control bar and unspin your lines.

OVERRIDE 2 STOPPER UNIT DETAIL

The Override™ 2Tension Ring allows the rider to choose the level of pressure it takes to unseat the stopper unit from its sleeve an enter Override™ mode. With each click of the tension ring, the release load increases and more force will be required to put the control bar into Override™ Mode.

Override™ 2 can also be used when performing unhooked tricks. First, be sure to unseat the Override™ stopper unit from its sleeve. Then connect your leash to the ring on the harness loop. If you drop the bar during a missed trick the kite will immediately depower and begin to drop from the sky.



1

Closing the tension ring increases release load - more force required to put the control system into override mode.

2

Opening the tension ring decreases release load - less force required to put the control system into override mode.

CONTROL SYSTEM WITH OVERRIDE™ 2

FEATURES

- > IMMEDIATE DEPOWER ON DEMAND
- > HANDS FREE BAR SPINNING
- > DEPOWER WITHOUT LETTING GO OF THE CONTROL BAR
- > OVERRIDE 2 STOPPER UNIT
- > USER DEFINABLE TENSION RING
- > STREAMLINE DESIGN

relaunch assist
OVERVIEW

FEATURES

> INSTANT RELAUNCH

> NO FIFTH LINE NEEDED

> LAUNCH EASILY ON WATER OR SNOW

DESCRIPTION

The kite's bridle makes relaunching off the water or snow a snap. When the kite is leading edge down on the water or snow, just pull on either the left or right leader line. The wing tip will rise off of the surface and allow the rider to position the kite into the side launch position. This is all possible without the use of a 5th line or additional wind tip fittings.

RELAUNCH ASSIST STEPS

1) With the kite leading edge down on the water or snow, pull on the left or right leader line.

2) The wing tip will rise up off of the water.

3) The kite will position itself into a side launch position ready to launch.

4) Maintain your hold on the leader with one hand while the other is holding onto the control bar.

5) Let go of the leader and place both hands on the control system.

6) Sheet the bar out and gently steer the kite into the sky.

durability
OVERVIEW

FEATURES

> IMPROVED LEADING EDGE REINFORCEMENT

> TRANSITIONAL STRUT REINFORCEMENT

> FLAT SEAM PANEL Construction

> 70 GSM TRAI

This season we take durability head-on with the addition of transitional strut panel materials and reinforced LE closing seams. We have reinforced the high load areas of our kites with a transitionally weighted material. This well-placed material acts as a buffer zone between the rigid strut areas and the canopy. The entire canopy of all kites are flat seamed and taped prior to sewing. This is 20% stronger than the free hand sewn method of a top stitch.

The leading edge closing seams now have additional layering to eliminate stitch combing.

The entire trailing edge implements a two-ply of tough 70 gsm material for added durability and strength.

Cabrinha implements many new construction techniques to improve the overall durability of the kite. We use flat seams exclusively in all of the leading edge panels. This results in stronger seaming especially in the closing seam. All of the body panels also feature taped flat seams for added strength.

The full contact between the strut and the leading edge helps to ensure a rigid frame. The positive connection not only provides stability while the kite is in flight but delivers added durability and a rapid relaunch.

An extra layer of Mark Cloth on the LE closing seams adds strength.

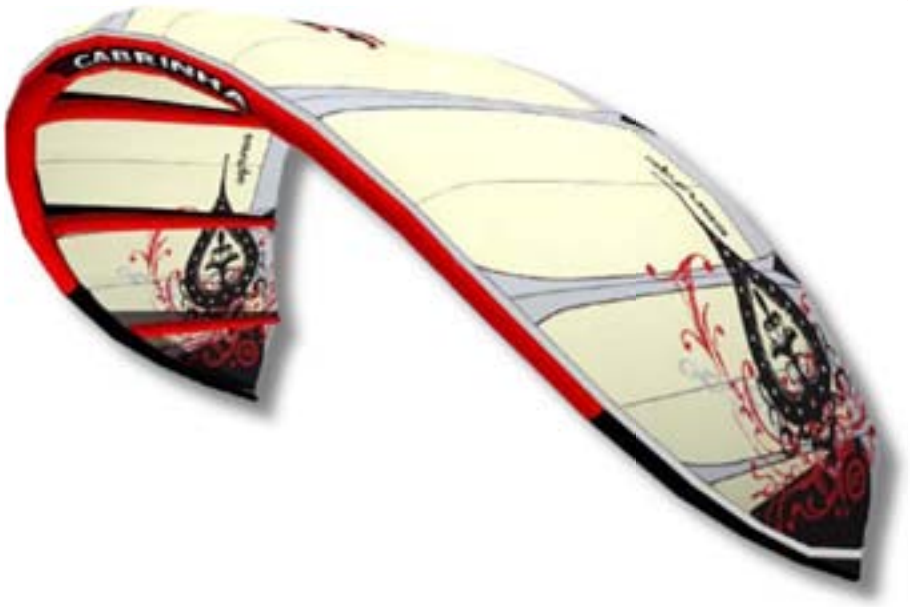
*LIMITED AVAILABILITY



DESCRIPTION

The third generation of our highly refined Contra kite raises the bar in light wind performance kiting. Designed to get the absolute best performance in light wind conditions, the Contra is made to deliver the speed and agility of a small kite and power and pull of a big kite.

The secret lies in our highly tuned profiles which produce much faster flying speeds. These profiles allow the kite to fly from point A - B in the power window much quicker and keep the kite feeling lively in the sky. This translates to overall better performance in marginal wind conditions.

The new Contra delivers much more than just performance. It covers all areas of Security, ease of use and durability that you would expect from Cabrinha.

The Contra Bow kite has everything you need to perform in the light wind arena, and nothing you don't need. Light wind is no longer a second rate alternative. Thanks to the Contra, your spectrum of great riding conditions just got expanded.

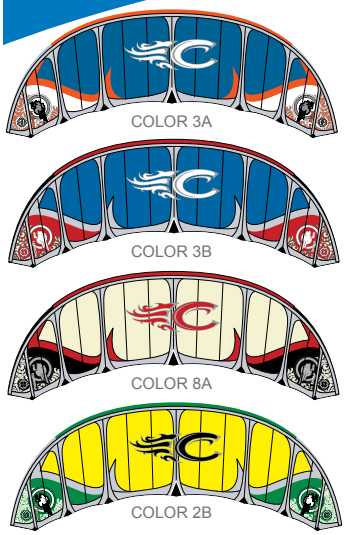
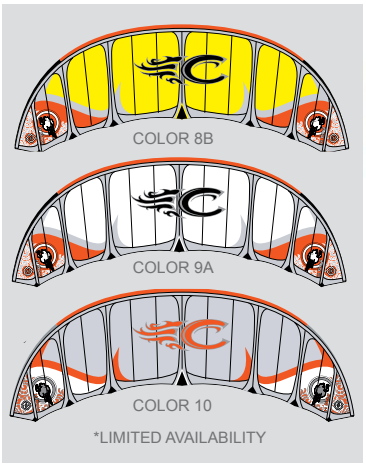
X bow

crossbow 3

Legendary Freeride Performance





DESCRIPTION

It hard to imagine that just 3 short years ago the Crossbow launched an entirely new level of performance and security that changed the face of kitesurfing. Today, in keeping with the philosophy that performance and security are no longer mutually exclusive, the Crossbow 3 brings you maximum performance, efficiency and security wrapped into a single kite. This makes the Crossbow 3 the ideal Freeride kite; a kite which can span many riding styles and categories.

The Crossbow has one of the widest wind ranges in our kite offering. The efficiency of this kite led to the creation of the “two kite quiver”. A unique condition in which two kites will handle the needs of most riders. A situation where less is definitely more.

The performance in the Crossbow 3 comes from the flatter, Pro Span™ Extreme arc and is fast flying profiles. The combination of these two produce more power per square meter than a conservative arc classic kite. Enough power to match the Crossbow’s legendary hang time reputation or to propel you into your next trick. The pin point control of the power comes from the Crossbow’s ability to depower on demand. You can fully depower the kite at anytime just by placing the bar into the Override™ mode.

Made to withstand the rigors of everyday abuse, the new durably constructed Crossbow 3 lets you ride with confidence knowing your kite is up to the task.

If you are looking for high hangtimes, trick riding, or just freeriding, the Crossbow 3 is the kite for you.

switchblade 3

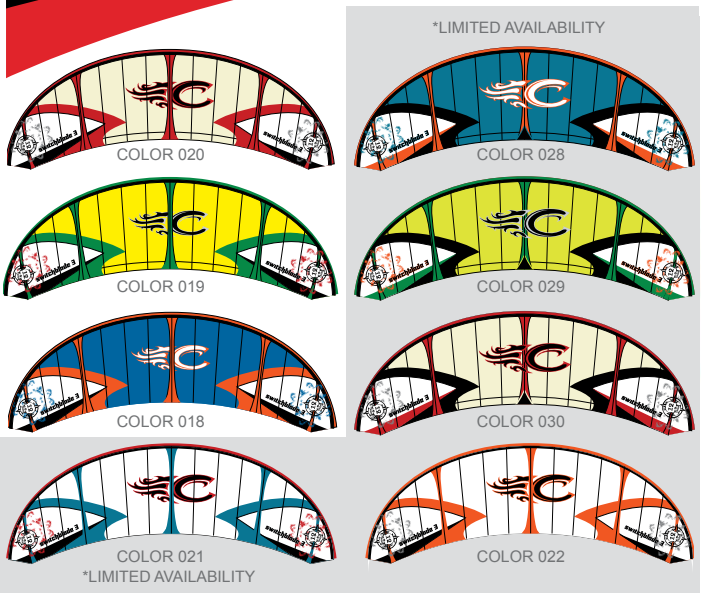
Core Wakestyle



DESCRIPTION

Core Wakestyle's ultimate power source can be found in the Switchblade 3. Now 100% dedicated to the cause, the Switchblade 3 delivers pure wakestyle performance to the masses. The Switchblade delivers a steady powerband with the ability to ride unhooked with ease. Kite loops, handle passes, and rail slides are the kinds of things the Switchblade 3 calls routine. When hooked in, the Switchblade 3 has the ability to tame gusts with its high depower capabilities and proven Override 2 security function.

The Switchblade 3 has a familiar feel of a classic kite with the increased performance and security of a flatter, high depower kite. With no pulley's on the control system there is virtually no bar pressure.

The Switchblade is as comfortable in professional level competition as it is in your backyard riding spot. The Switchblade 3. Making pro level wakestyle kite performance accessible to all.

COLOR 032

COLOR 033

DESCRIPTION

The Revolver HD is coming your way this season as our premier dedicated surf kite. The brief we gave our chief designer Pat Goodman, was to build us a kite that is: Fast turning. High Depowering. Responds immediately to edge input. And is built with the most durable strength to weight ratio materials available to us. The result is nothing short of spectacular.

The Revolver HD is your personal power source for true kite surfing. Its as close as it gets to the real thing with the added benefits of power to get you in and out of the line up. Tow yourself into a wave with the Revolver and feel what it is like to actually surf without having the kite over-power your turns.

The Revolver HD's defining characteristic is that its right there when you need it... and virtually invisible when you don't.

The conservative amount of Pro Span™ Extreme makes the Revolver incredibly stable. But more so, it makes it turn on a dime. The Revolver's inherent turning speed allows you to surf tight in the pocket and put the kite wherever you need it in an instant.

The new frontier in kitesurfing has come full circle back to its surfing roots. Cabrinha, the company founded on the very core of surfing now brings you the ultimate surf kite. The Revolver HD.

If you are looking for a surf kite with the technology of the future but the soul of surfing's past..... look no further than the Revolver HD.

CONVERT

CONVERT

All-Round Freeride

COLOR 032

COLOR 033

DESCRIPTION

The Convert bow kite is a reflection of the people who do our sport. Rugged, and technical...with a sense of ease. The Convert is simply the easiest and most secure way to get yourself up and riding in the shortest amount of time, with the least amount of hassles.

The secret to the Convert's simplicity lies in its stable Pro Span™ arc and bow kite bridle. The combination of these two features creates an easy flying kite that gives you complete control over the power and more importantly...the depower. The way the Convert quickly flies forward to the edge of the window makes it a snap to get past your first milestone in kitesurfing - Going Upwind.

But that's not where it stops. The Convert is designed to grow with your abilities so that as you quickly learn, the kite will back you up with performance to match. Performance characteristics like quick turning and easy jumping with incredible hang times. If you decide to venture into the surf you'll love the high depower function of the Convert so you can focus more on your surfing than on flying your kite.

If you'd like to ride unhooked, the Convert quickly converts into 1:1 mode. 1:1 mode means disabling the pulleys on the control system which will favor unhooked trick riding. In the 1:1 mode virtually all of the bar pressure is eliminated resulting in smooth power and depower delivery.

The Convert kite. Kitesurfing has never been easier.

DESCRIPTION

The Convert bow kite is a reflection of the people who do our sport. Rugged, with a sense of ease. The Convert is simply the easiest and most secure way to get yourself up and riding in the shortest amount of time, with the least amount of hassles.

The Convert is a full scale Bow kite from leading edge to trailing edge. This design delivers an incredibly wide wind range, stable easy handling and perhaps the most important feature on any kite ..... an enhanced relaunch function that is second to none.

RELAUNCH ON COMMAND
The Convert's relaunch capability is so easy that your hands never have to leave the control system. By simply pointing the end of the control system towards the kite, the wing tip will rise off of the water and launch the kite into the sky. Unlike other relaunch methods, The Convert allows you to decide when to launch the kite and which direction it goes into the air. Its simple... and it keeps the control in your hands... where it should be.

Two of the elements credited for the Convert's amazing relaunch are:
The curved shape of the leading edge and the swept wing tips. Together they allow the kite to "unstick" by reducing contact to the water or snow when the leading edge is face down. The constant curvature of the leading edge allows the kite to easily roll onto a wing tip and lift off the water.

The Bow kite bridle is also responsible for allowing you to choose the direction you would like to launch the kite. This clearly puts the Convert in a class of its own amongst a sea of hybrid kites which don't allow this function. This important function becomes an added safety feature when your kite is sitting next to an obstacle like rocks, a pier, other riders or swimmers.

For example: if you want to lift the right facing wing tip just point the right side of the control system directly at the kite and hold until the wing tip rises off of the water. When the kite launches you can easily control how fast or how slow you d like it to fl .

If you want to speed up the relaunch process you can always just grab a leader line instead, flip the kite on its side and shoot it up into the sky. The Convert's easy relaunch sets a new standard in kite control. Simple. Fast. And at your command.

The feature packed Convert comes standard with:
Sprint. Our single point inflation system. You can easily inflate the kite by connecting the pump to a single valve.

Override 2. The ability to depower on demand by just pushing the control bar away from the rider.

The Convert comes with our versatile Powerdrive 2N1 S control system. The 2N1 S control system allows you to ride in either the 2:1 pulley mode or the 1:1 mode with the pulleys disabled.

In 2:1 mode the pulleys effectively double the steering, powering and depowering inputs. For the amount of distance you move the control bar you effectively double the reaction on the kite. This creates precision control, rocket fast turning, and puts you in charge of your kite at all times.

In 1:1 mode the disabling of the pulleys virtually eliminates all bar pressure and provides a smooth power and depower band. Great for freeriding and unhooked wakestyle riding. The Powerdrive 2N1 S comes with our Bypass leash.

If you are looking for an all round freeride kite that will perform in a wide variety of conditions and riding styles. One with an industry leading relaunch system, look no further than the Convert kite from Cabrinha.

The Convert kite from Cabrinha. Kitesurfing has never been easie .

DURABILITY

A new robust construction with transitional strut reinforcements and higher strength materials in the durability prone areas.

The Convert SE tackles durability with a tough Dacron leading edge, struts, trailing edge and wing tip areas. These areas transition into the canopy with transitional strut reinforcement materials, creating a solid framework around the canopy. The canopy is made up of 92 gsm (standard canopy material is 53 gsm) to stand up to the abuse that a school kite is likely to receive.

Powerdrive 2N1 - XBOW / CONTRA

DESCRIPTION

The Powerdrive 2N1 can be ridden in either the 2:1 pulley mode or the 1:1 non pulley mode depending on your riding preference.

The 2:1 pulley mode increases the effects of your steering and depowering input. For the amount of distance you move the control system you effectively double the reaction on the kite. The 1:1 mode virtually eliminates the bar pressure and lends itself to a smooth power delivery.

The Powerdrive 2N1 control system comes standard with our Override 2 stopper unit. The stopper unit provides the rider with a place to rest the control bar when unspinning his or her lines. There is a user adjustable tension ring which lets you choose the amount of pressure it takes to unseat the stopper unit and enter the Override mode. The Override 2 stopper unit also integrates our bungeed power adjusters. The easy to use power adjusters put the trim of your kite easily within reach. This often imitated but never duplicated feature keeps your entire control system simple, streamlined and free of clutter.

The Powerdrive 2N1 control system implements our new forged alloy center section with an expanded entry and exit opening for the depower line. This feature increases the ease of bar movement over the depower line even at extreme angles.

The Powerdrive 2N1 features our adjustable Override™ 2 stopper unit, 2:1 pulley system (which quickly converts into a 1:1 system), bungeed power adjusters, centerline adjustment trim strap, soft embossed EVA grip, a quick release harness loop and a Bypass security leash.

FEATURES

control system

Powerdrive 1:1 - SWITCHBLADE

DESCRIPTION

From the moment you put your hands on our Powerdrive 1:1 control system you'll ask yourself "Where is the bar pressure". Thats because the Powerdrive 1:1 control system without pulleys delivers absolute control over the power of your kite without the increase in pressure caused by pulleys. But don't let the lack of bar pressure fool you. The Powerdrive 1:1 features our Override security system resulting is the kind of security you'd expect from a Cabrinha product.

The Powerdrive 1:1 control system comes standard with our Override 2 stopper unit. In addition to its hands free spinning feature, the Override 2 stopper integrates our bungeed power adjusters. The easy to use power adjusters puts the trim of your kite easily within reach. This often imitated but never duplicated feature keeps your entire control system simple, streamlined and free of clutter.

The Powerdrive 1:1 control system now implements our new forged alloy center section with an expanded entry and exit opening for the depower line. This feature increases the ease of bar movement over the depower line even at extreme angles.

The Powerdrive 1:1 features our adjustable Override™ 2 stopper unit, bungeed power adjusters, centerline adjustment trim strap, soft embossed EVA grip, a quick release harness loop and a Bypass security leash.

FEATURES

- ***> NO PULLEYS. REDUCED BAR PRESSURE.***
- ***> OVERRIDE™ 2 TECHNOLOGY***
- ***> STOPPER UNIT WITH ADJUSTABLE TENSION RING***
- ***> BUNGEED POWER ADJUSTERS***
- ***> QUICK RELEASE HARNESS LOOP***

boards

technology
Board Technology

CORES

PVC

Super light, tough, low density foam core. The basic advantage of this material is its light-weight, and ease of milling a precise core shape; producing a consistent result every time. Average Density: 75kg/m³

WOOD

Vertically laminated Paulownia stringers produce a high compression/ lightweight core. Paulownia has one of the highest strength to weight ratios of all wood species.The result is simple. Bullet proof, with a smooth, consistent flex pattern. Average Density: 310kg/ m³

X-48

The X stands for Extruded Poly Styrene (XPS). XPS offers a high impact resistances and a better strength to weight than regular EPS. It is completely water tight and provides an excellent bond to the laminate. Average Density 48kg/m³

FIBERGLASS LAMINATES

QUADRAX

A four axis weave of fiberglass that is extremely strong and light resulting in a very lively feel and response.

BI-AXIAL

A simplified weave ensuring durability with a loose feel.

HARD GLASS

A pre-laminated fiberglass that's pre-tensioned and cured under pressure. We apply this to the board in strategic locations to increase strength with a minimal increase to the weight. It's the strongest fiberglass available! Hands-down!

TOPAND BOTTOM SHEET

A light-weight and tough material. Its' UV and Scratch resistance properties' makes it perfect for Kite Board production.

ABS RAILS

The ABS sidewall is laminated to the core during the Lay-Up process. It's designed to increase the strength while ensuring a smooth, durable and consistent ride.

CORE PROFILES

All our cores are produced with CNC milling. This means that every core is true to our design. Flex, profile and manufacturing consistency are all exact, every time.

FLEX PATTERN

TRUE TWIN FLEX

A symmetric pattern provides an identical flex, forward or switch, ideal for all types of riding conditions.

SURF

Surfboards flex under load. This flex provides spring out of the turn and offers control. Our cores and lay-ups are developed specifically for kitesurfing.

MOUNTING SYSTEM

STAINLESS STEEL INSERTS

Based on the industry standard 6 inch (15.24cm) pattern. Our Stainless steel inserts are custom made to eliminate pull out and spinning. Our inserts are all ¼-20 thread and sized to properly fit the core profiles. They are inserted from the bottom of the core, glued and are in for good.

ARRANGEMENT/ LAYUP

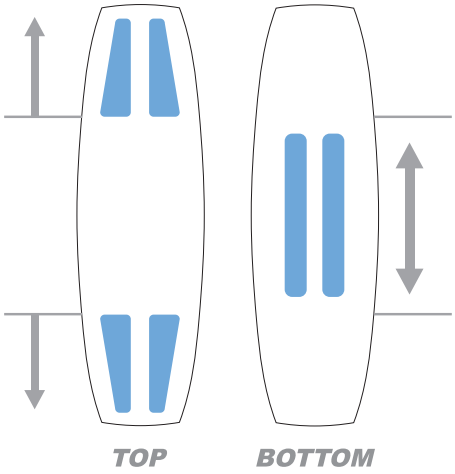
LAMINATE

Each board has its own unique layup. We have tested many different configurations of the laminate to produce the best combination of strength and weight. The Cores are profiled to dial in the specific flex for a design. Then the laminate is applied to support the flex and increase strength.

STANCE OPTIONS

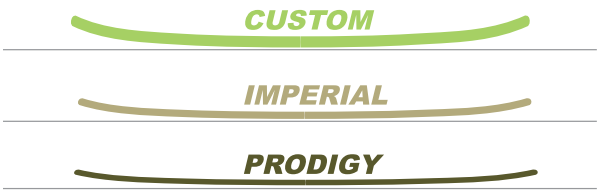
The Stance options provided are design specific based on the rider size and style. The Prodigy and the larger two sizes of the Imperial have a 14/17 inch option for all around freeride performance. The Smaller Imperial stance of 13/15 fits the smaller targer rider. The Custom features a 16/18 footstrap stance with a 20" binding stance for the wakestyle rider.

technology
Board Technology



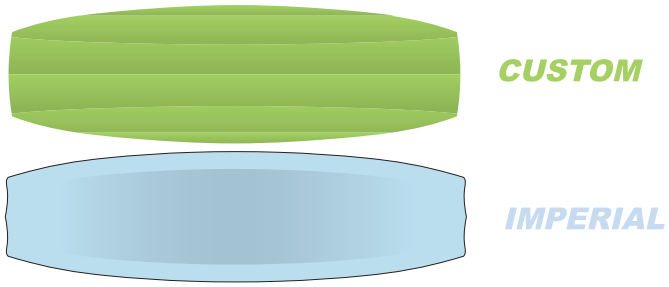
FLEX SUPPORT

Kiteboards are subject to high shock loads. Wake-style, flat landing, kite loops and sliders wear heavy on a board. By adding spot reinforcement, we have addressed these loads without adding thickness or weight.



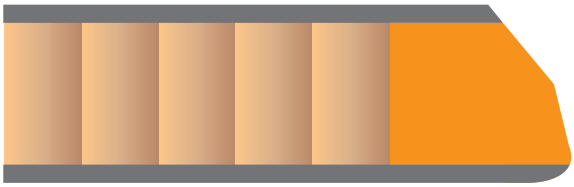
ROCKER

The rocker is a key element in the overall feel and performance of your board. We use three distinct rockers based on the performance targets of the boards.



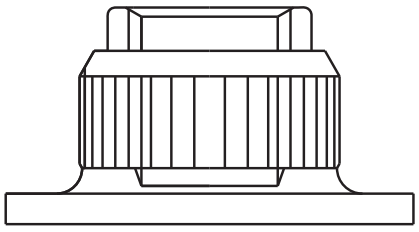
BOTTOM SHAPE

Design specific bottom contours are added based on the boards performance demands. Single concave with rail chines on the Imperial improve tracking and smooth out the ride in Chop. Custom quad concaves increase tracking and add performance for finless riding.



ABS SHAPED SIDEWALLS

Shaped sidewalls allows precise edge control and provide smooth traansition on sliders.



BINDING INSERTS

Our Stainless steel inserts are custom made to eliminate pull out and spinning.

DESCRIPTION

Kitesurfing has come full circle back to its surfing roots with the introduction of the S-Quad. Years of design experience has gone into making the perfect kite surfboard. The S-Quad has all of the design elements of a true surfboard with the construction to match the kind of abuse the surf will likely dish out.

Designed by Pete Cabrinha, the S-Quad blends his fast tow-surfing rockers with a wider curvier outline to deliver a board that powers off the bottom and snaps in the hook. The 4 fins allow the rail to hold when you need it and let it bust loose on demand.

The S-Quad is constructed with an X-48 EPS core and a composite skin. The x-48 construction has been custom developed to the Cabrinha S-quad. The XPS core is machined to offer the optimal shape. A full wood laminate under the feet provides strength and impact resistance. We use a multi weight glass lay-up to provide the best combination of strength and weight.

When ridden with the new Revolver HD surf kite, its as close as you'll get to the real thing. If you want just one board to handle a wide range of surf conditions the S-Quad is your board.

DESCRIPTION

The all new Custom wake board breaks away from the pack with an entirely new approach to bottom design. The Custom sports a quad concave bottom and a new outline to deliver the ultimate combination of speed and drive. Developed and tested by Andre Phillip, the leader in the wakestyle movement, the Custom is dedicated to progressive wake style riding. The Custom can be ridden fin less when hitting sliders and still be able to throw down any trick in the book. Whether you are into flat water tricks or hitting obstacles, the Custom will allow you to push your riding to the limits.

The new improved construction now implements hard glass to increase strength and deliver a better flex pattern. The PVC core is precision milled and all materials are strategically placed to deliver the optimum weight, flex and rebound.

We've designed an entirely new component set to lower the weight and to raise the finish standard even higher. Our new 3D molded foot pad fits like a well worn shoe. The dual density EVA will cradle your foot from side to side and protect it from the impact of hard landings. The widebody adjustable foot strap is extremely simple to attach and easy to adjust to a perfect fit.

The Custom also comes standard with 4 high quality glass fins and a handle.

DESCRIPTION

The Imperial continues to be the choice of riders who want to excel in all styles of riding. Since the Imperial lends itself to high speed riding through rough or choppy waters, we've added a concave bottom shape to help you get up to speed quicker. To handle the speeds even better, we've changed the outline slightly to increase the edge response and tracking. This has all been done while maintaining the forgiving feel and easy ride that it is well known for.

The new improved construction now implements hard glass to increase strength and deliver a better flex pattern. The PVC core is precision milled and all materials are strategically placed to deliver the optimum weight, flex and rebound.

We've designed an entirely new component set to lower the weight and to raise the finish standard even higher. Our new 3D molded foot pad fits like a well worn shoe. The dual density EVA will cradle your foot from side to side and protect it from the impact of hard landings. The widebody adjustable foot strap is extremely simple to attach and easy to adjust to a perfect fit.

The Imperial also comes standard with 4 high quality glass fins and grab handle.

DESCRIPTION

The Prodigy is the perfect first board as it will get a rider tracking upwind with it easy to control handling. From there it'll grow with you as you quickly progress through the stages. The reason for its easy handling and smooth feel lies in the combination of its wood core, fast rocker line, and forgiving outline. The wood core is responsible for its flex and dampening through the choppy water. The fast rocker will get a rider up on a plane quickly yet allow him or her to control their speed through the Prodigy's superior edge control.

Built to last, the combination of a wood core and biax glass present a unique blend of weight and durability. We've designed an entirely new component set to lower the weight and to raise the finish standard even higher. Our new 3D molded foot pad fits like a well worn shoe. The dual density EVA will cradle your foot from side to side and protect it from the impact of hard landings. The widebody adjustable foot strap is extremely simple to attach and easy to adjust to a perfect fit.

The Prodigy also comes standard with 4 high quality glass fins and a handle.

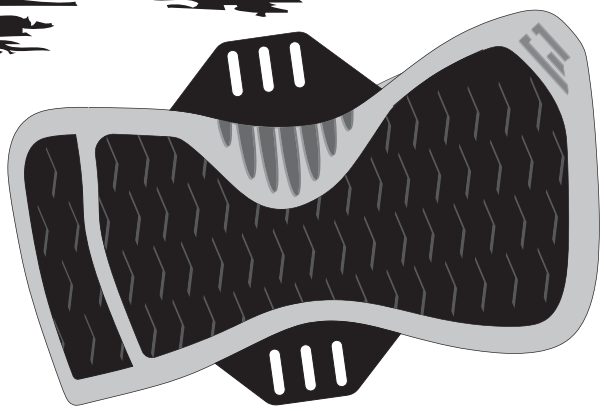
components

Board Components

3D FOOT PADS

The new generation foot pads have been redesigned with performance, light weight, and ease of use. The new molded EVA mid section reduces weight. As well the plate has been canted to give better ergonomics. A new outline provides a solid foot position and integrates the cut EVA grip area. The Internal plastic is pre-curved and has the weight greatly reduced.

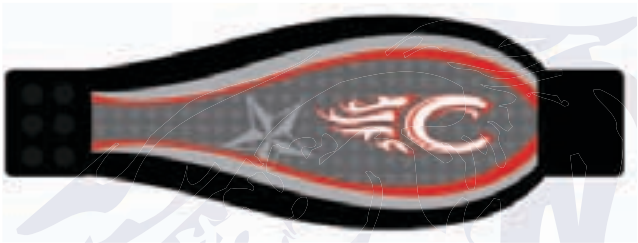


WIDEBODY ADJUSTABLE FOOT STRAP

The strap has been totally redesigned for the new model. Fit, function, styling, and ease of mounting have all been addressed. Traditional footstraps lose their fit as the strap gets bigger or smaller. By adding two side adjustment the strap stay centered on your foot. The internally molded Side Curtain EVA eliminates any contact with the adjustment webbing no matter how large you make the strap. When the strap is in its smallest the there is no added bulk. The outboard tongue can be removed to allow easy mounting of the strap. This feature also allows the strap to be left on the board for traveling.

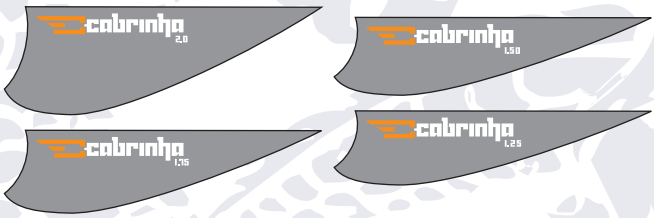
SURF STRAPS

If you are looking for the most comfortable surfing footstrap on the planet look no further than the Cabrinha surfstrap (WBD). The Cabrinha surfstrap has mirrored the evolution of the surfing trend to meet the needs of the hard core surfer. The asymmetrical outline is perfect for riding goofyfooted or regular on the same board. Developed on the North Shore of Maui, this strap is also perferct for tow-surfing.



WAKE FINS

Cabrinha wake fins are precision foiled for high speed and control. Our thin foils have been proven to give you the right amount of bite without excess drag. Fins are constructed of fiberglass plate for added durability and a solid grip on the mounting screw threads. Fits all Cabrinha boards. All sizes of fins come in a pack of 4 fins with 8 screws.



SURF FINS

Cabrinha has developed a set of surf fins to harness the power of the S-quad surf board. The 4 fins allow the rail to hold when you need it and let it bust loose on demand. Two 4” inch lead fins and two 3.25” inch rear fins round out the back. Fins come in a pack of 4 with 8 screws.

BOARD COMPONENT PACK

Includes required parts to assemble Cabrinha boards. This box can be purchased separately, or with this season's board range.

- 1 x Handle (with screws)
- 2 x Footstrap
- 2 x Footpads
- 4 x 2" Fins
- 4 x Footstrap Washers
- 4 x Footstrap Screws 1/4-20 x 0.76" (19.5mm)
- 8 x Fin Screwes 10-24 x 0.75 (19.0mm)

FEATURES

> X-FLEX POWERSTRAP DELIVERS COMFORTABLE RESPONSE AND SUPPORT.

> NEW LOWER-DUROMETER EVA BASE PAD IMPROVES THE CONNECTION TO THE BOARD WHILE DAMPENING THE RIGID FEEL ASSOCIATED WITH TRADITIONAL METAL BINDINGS

> TWO NEW LOCKING MINIRATCHET BUCKLES ON EACH BINDING PROVIDE A CUSTOMIZED STRAP-FIT TO ANY BOOT

DESCRIPTION

The Effect binding brings to snowkiting the ultimate in performance and ease of use. The direct yet relaxed feel of the Effect binding delivers the kind of rider to board connection that is essential for long periods of edging. Its design is perfect for all mountain and freestyle riding, providing a forgiving feel during hard landings and all day riding.

The Effect binding is built with the Flow core Technology. The Flow Technology with its reclining hi-back allows the rider to easily get in and out of the binding even with kite in hand. This simple entry and exit of the binding is essential to snowkiting.

DESCRIPTION

Whether you are into freestyle tricks, big air or just freeriding, the Empire will expand your possibilities. The Empire snowboard is a true twin tip with a Dual transitional sidecut, Structurn and Energy Plates. Featuring high strength to weight ratio wood core, the Empire is designed for a smooth ride in all conditions. The core is profiled to deliver an even response to long periods of edging which is unique to snowkiting.

The Quadrax orientation of the lay-up distributes binding pressure over a greater area, because the 30-degree axis fibers add extra torsional stiffness. The stainless treated steel edges and Crystal EzCare base all make for a snowkite board with the highest durability.

- *> 4-POINT HARNESS BAR ATTACHMENT*
- *> HARNESS BAR PAD*
- *> KNIFE*

DESCRIPTION

The Cabrinha Impact series of harness has been on the forefront of comfort and performance since it s introduction. This year we have focused on improving the fit, function, and feel. We utilize new materials and construction methods with a refined design.

The full wrap design locks the harness in place which makes this the preferred harness for freeride, freestyle and surf. The body of the impact waist is made with a combination of Thermoform and our exclusive impact mesh material which helps to dissipate the energy when hitting the water at high speeds.

The 4 point spreader bar connection will keep the hook firmly in place when you ride, causing immediate kite response from your body movements. The new harness hook pad ensures your comfort and fits the new EZ Release spreader bar.

Deluxe Seat Harness

FEATURES

- *> 8-POINT HARNESS BAR ATTACHMENT*
- *> THERMOFORM BODY*
- *> 3D SHAPING*
- *> KNIFE*

DESCRIPTION

The Cabrinha Deluxe Seat Harness is quite possibly the most comfortable way to go riding. The body shape of the seat harness keeps the hook right around your center of gravity . This low hook position is ideal for transferring the load directly to the rail of your board. The result is a higher level of board control in strong winds and choppy water.

The 8-Point spreader bar connection will keep the hook firmly in place when you ride, causing immediate kite response from your body movements.
